Quick question: audit wants the exceptions that became normal

Morning,

I need help with something that sounds simple but probably is not.

Audit is testing whether approvals, declines, restrictions and collections outcomes are consistent with recorded policy inputs. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

The questions I would ask in the room are:
1. What would we expect to see if a channel or period has a materially different decision pattern?
2. What evidence would instead support that overrides are rare and explainable?
3. How do we rule out that missing data looks like an override?

We looked at a version of this before. For the September 2020 review, please show what changed and whether the earlier conclusion still holds. Please work towards the sample for process-owner walkthroughs and policy evidence. A useful output would be a control view with the exceptions, owner and reason each item was included.

Use the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; monthly account snapshots, status events, limits, product enrolments and signatories; collections cases, promises to pay and recovery payments; monthly customer and KYC snapshots. One caution: The files do not contain every approval authority or policy version; flag unexplained differences rather than declaring misconduct.

Regards
