Can the KYC population be reproduced without manual repair? - 2024 control review

Hi,

This came up in a working session and nobody had the same definition.

Regulatory Reporting needs a reproducible population of active, restricted and closed accounts with the relevant customer due-diligence fields.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: snapshot timing explains the difference; company and individual rules are being mixed; or status changes are not applied consistently.

The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2024 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the agreed population rule, data-quality exceptions and evidence trail. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories. The dataset can test completeness and consistency, not determine whether every document is authentic.

Thank you
