Where did the process override its own rule?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Audit is testing whether approvals, declines, restrictions and collections outcomes are consistent with recorded policy inputs. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that overrides are rare and explainable? Or are we actually seeing that a channel or period has a materially different decision pattern? I also do not want us to miss the possibility that missing data looks like an override.

The practical decision is the sample for process-owner walkthroughs and policy evidence. Please send a Power BI page with drill-through to a reproducible case list; I need the exceptions and counter-examples, not only an average.

Work from the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; monthly account snapshots, status events, limits, product enrolments and signatories; collections cases, promises to pay and recovery payments; monthly customer and KYC snapshots. The files do not contain every approval authority or policy version; flag unexplained differences rather than declaring misconduct.

Regards
