Follow-up: which fields belong in the shared analytical view?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Teams are asking for customer identity, risk, income and contact fields in broad analytical extracts. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Could the answer be that different projects require different retention and access? Or are we actually seeing that restricted identifiers are being copied for convenience? I also do not want us to miss the possibility that most use cases need derived or masked fields.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2021 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the shared schema, restricted extension and audit trail. Please send a model-ready table, data dictionary and an honest baseline; I need the exceptions and counter-examples, not only an average.

Work from monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. Minimise access to identity, contact, protected and investigation fields; usefulness alone is not a lawful purpose.

Regards
