Digital volume is not the same as lower cost - 2025 control review

Hi,

This came up in a working session and nobody had the same definition.

Digital use is rising, but repeat calls, branch visits and failed journeys may mean the bank is serving the same need more than once.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: a small set of broken journeys creates most repeat contact; customers begin digitally and finish through an assisted channel; or digital journeys are resolving customer needs.

There is no confirmed problem yet; this is a request to test an assumption before it becomes policy. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2025 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which journeys should be fixed before another channel-adoption campaign is funded. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. The dataset can measure repeat contacts and channel sequences, not fully allocated service cost.

Thank you
