Are cross-border flows recurring or episodic? - 2024 control review

Hi team,

Treasury sees non-rand activity but needs to separate stable customer behaviour from isolated transactions and data artefacts.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2024 as the new evidence point rather than recycling the earlier conclusion. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Can you test these explanations rather than choosing one at the start?
- loan participations explain part of the flow
- cross-border-enabled accounts are not the same as active cross-border users
- a small group of customers drives most foreign-currency activity

The decision is whether to improve forecasting assumptions or investigate specific flow concentrations. Please give us a working Excel file with the exception population and clear columns.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; loan participation and servicing records available by the request date. This data does not contain market positions, hedges or intraday liquidity; report customer-flow concentration only.

Thanks
