Vendor performance without a vendor master

Morning,

I need help with something that sounds simple but probably is not.

Third-Party Risk wants to understand whether external dependencies are repeatedly associated with failed or delayed customer journeys. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

The questions I would ask in the room are:
1. What would we expect to see if internal latency is being attributed externally?
2. What evidence would instead support that repeat incidents create disproportionate customer contact?
3. How do we rule out that third-party timeouts cluster by channel?

We looked at a version of this before. For the November 2019 review, please show what changed and whether the earlier conclusion still holds. Please work towards which supplier relationship requires evidence gathering or a formal service review. A useful output would be a one-page finding note plus the underlying CSV for our own review.

Use transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. One caution: There is no vendor master, contract, SLA or invoice table. Treat external-context fields as indicators, not contractual proof.

Regards
