The rejection code may be doing too much work - 2024 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Credit Risk needs to know whether recorded decline reasons are consistent with affordability, documentation and workflow evidence. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Could the answer be that channel differences indicate process inconsistency? Or are we actually seeing that decline codes align with application facts? I also do not want us to miss the possibility that generic reasons are masking multiple causes.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which policy rules, reason codes or quality checks need revision. Please send a short decision pack with no more than five slides and an attached evidence table; I need the exceptions and counter-examples, not only an average.

Work from the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories. The separate rejected-account file and loan decisions represent different processes; do not merge them without a defined key and business rule.

Regards
