What is driving the non-rand flow?

Hi team,

Treasury sees non-rand activity but needs to separate stable customer behaviour from isolated transactions and data artefacts.

The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Can you test these explanations rather than choosing one at the start?
- cross-border-enabled accounts are not the same as active cross-border users
- a small group of customers drives most foreign-currency activity
- loan participations explain part of the flow

The decision is whether to improve forecasting assumptions or investigate specific flow concentrations. Please give us a one-page finding note plus the underlying CSV for our own review.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; loan participation and servicing records available by the request date. This data does not contain market positions, hedges or intraday liquidity; report customer-flow concentration only.

Thanks
