Follow-up: how stable are our retail inflows?

Hi team,

ALM wants a directional view of retail funding stability based on transaction behaviour and account persistence.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2021 as the new evidence point rather than recycling the earlier conclusion. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

Can you test these explanations rather than choosing one at the start?
- customers with service problems move money out faster
- large opening deposits overstate durable funding
- salary-like and recurring inflows are more stable

The decision is which behavioural assumptions deserve formal modelling when balance and regulatory data become available. Please give us a model-ready table, data dictionary and an honest baseline.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; available initial-deposit records up to the request date; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. There are no daily account balances, wholesale funding positions or regulatory cash-flow buckets, so do not calculate LCR or NSFR.

Thanks
