Follow-up: what is driving the non-rand flow?

Hi,

This came up in a working session and nobody had the same definition.

Treasury sees non-rand activity but needs to separate stable customer behaviour from isolated transactions and data artefacts.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: cross-border-enabled accounts are not the same as active cross-border users; loan participations explain part of the flow; or a small group of customers drives most foreign-currency activity.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2022 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is whether to improve forecasting assumptions or investigate specific flow concentrations. Please bring a Power BI page with drill-through to a reproducible case list, including a few cases we can trace from source to conclusion.

The available evidence is monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; loan participation and servicing records available by the request date. This data does not contain market positions, hedges or intraday liquidity; report customer-flow concentration only.

Thank you
