Promise-to-pay quality, not collector volume

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Collectors record promises with different amounts and dates, and management needs a fair measure of promise quality. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Could the answer be that channel and timing affect outcomes? Or are we actually seeing that affordable promises are kept more often? I also do not want us to miss the possibility that partial payments are being treated inconsistently.

We looked at a version of this before. For the March 2020 review, please show what changed and whether the earlier conclusion still holds. The practical decision is the promise definition, coaching view and model target. Please send a control view with the exceptions, owner and reason each item was included; I need the exceptions and counter-examples, not only an average.

Work from collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; customer contacts, complaints and suggestions. Do not rank individual collectors without workload, assignment and contact-attempt history.

Regards
