Follow-up: A kept promise should be defined before it is measured

Hi,

This came up in a working session and nobody had the same definition.

Collectors record promises with different amounts and dates, and management needs a fair measure of promise quality.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: channel and timing affect outcomes; affordable promises are kept more often; or partial payments are being treated inconsistently.

The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2022 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the promise definition, coaching view and model target. Please bring a Power BI page with drill-through to a reproducible case list, including a few cases we can trace from source to conclusion.

The available evidence is collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; customer contacts, complaints and suggestions. Do not rank individual collectors without workload, assignment and contact-attempt history.

Thank you
