Reperform one risk number end to end

Morning,

I need help with something that sounds simple but probably is not.

Management reports are expanding faster than the evidence showing how each number was sourced, transformed and approved. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

The questions I would ask in the room are:
1. What would we expect to see if different teams use the same label for different populations?
2. What evidence would instead support that manual exclusions are changing the answer?
3. How do we rule out that the number can be reperformed from source?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2021 as the new evidence point rather than recycling the earlier conclusion. Please work towards which data controls must be formalised before the next assurance review. A useful output would be a short decision pack with no more than five slides and an attached evidence table.

Use monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; customer contacts, complaints and suggestions. One caution: Do not create a full enterprise lineage claim; reperform a defined metric and document every limitation.

Regards
