Which source change silently changed the business answer? - 2025 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Data Engineering sees changing schemas and needs to distinguish safe expansion from business-definition drift. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that renamed or recoded fields break history? Or are we actually seeing that null patterns reveal a source rollout rather than missing customer data? I also do not want us to miss the possibility that new fields are additive.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2025 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the data contract, quarantine rule and backfill requirement. Please send a short decision pack with no more than five slides and an attached evidence table; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. A technical schema match does not prove semantic consistency; business owners must confirm meaning.

Regards
