Are cross-border flows recurring or episodic?

Hi team,

Treasury sees non-rand activity but needs to separate stable customer behaviour from isolated transactions and data artefacts.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2020 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Can you test these explanations rather than choosing one at the start?
- loan participations explain part of the flow
- a small group of customers drives most foreign-currency activity
- cross-border-enabled accounts are not the same as active cross-border users

The decision is whether to improve forecasting assumptions or investigate specific flow concentrations. Please give us a control view with the exceptions, owner and reason each item was included.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; loan participation and servicing records available by the request date. This data does not contain market positions, hedges or intraday liquidity; report customer-flow concentration only.

Thanks
