The return population changes depending on which snapshot we use - 2025 control review

Hi,

This came up in a working session and nobody had the same definition.

Regulatory Reporting needs a reproducible population of active, restricted and closed accounts with the relevant customer due-diligence fields.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: company and individual rules are being mixed; status changes are not applied consistently; or snapshot timing explains the difference.

Please start with the decision we need to make, then show whether the available evidence is strong enough to support it. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2025 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the agreed population rule, data-quality exceptions and evidence trail. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories. The dataset can test completeness and consistency, not determine whether every document is authentic.

Thank you
