The loan return needs a population bridge - 2024 control review

Team,

Before this becomes another standing report, can we answer the real question?

Risk, Lending and Reporting are counting applications, approvals, booked loans and distressed accounts from different starting populations. The possible stories are that booked loans are missing from downstream repayment views, that workflow timing explains most differences, or that declined and withdrawn cases are mixed.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2024 as the new evidence point rather than recycling the earlier conclusion. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Please prepare a Power BI page with drill-through to a reproducible case list. The output must help us decide the canonical population and exception rules for the next return.

Data available: the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context.

Please state the limitation plainly: Do not present this as an official regulatory return without the required regulatory taxonomy and sign-off.

Thanks
