The bot contained the conversation, not necessarily the issue

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Digital containment is being reported as success even when customers later call, visit a branch or complain. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Could the answer be that certain intents should begin with an agent? Or are we actually seeing that contained contacts resolve the need? I also do not want us to miss the possibility that handover occurs too late.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which intents belong in self-service and how success should be measured. Please send a model-ready table, data dictionary and an honest baseline; I need the exceptions and counter-examples, not only an average.

Work from customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories. Containment is a proxy; use repeat contact and observable outcomes rather than claiming customer satisfaction.

Regards
