Quick question: rapid in-and-out movement needs a proper comparator

Team,

Before this becomes another standing report, can we answer the real question?

Financial Crime wants to test whether rapid receipt and onward movement forms a network pattern or reflects ordinary customer behaviour. The possible stories are that new accounts act as pass-through accounts, that shared beneficiaries connect otherwise separate customers, or that salary, family support or business cash flow explains the pattern.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2021 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Please prepare a control view with the exceptions, owner and reason each item was included. The output must help us decide which cases deserve investigation and which monitoring rule needs a better peer group.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; debit-order mandates, collection dates, suspensions and cancellations.

Please state the limitation plainly: The output is a triage hypothesis. Do not label a customer a mule without investigation and external evidence.

Thanks
