# New column, renamed field or changed meaning? - 2024 control review

Morning,

I need help with something that sounds simple but probably is not.

Data Engineering sees changing schemas and needs to distinguish safe expansion from business-definition drift. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

The questions I would ask in the room are:
1. What would we expect to see if renamed or recoded fields break history?
2. What evidence would instead support that null patterns reveal a source rollout rather than missing customer data?
3. How do we rule out that new fields are additive?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2024 as the new evidence point rather than recycling the earlier conclusion. Please work towards the data contract, quarantine rule and backfill requirement. A useful output would be a working Excel file with the exception population and clear columns.

Use monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. One caution: A technical schema match does not prove semantic consistency; business owners must confirm meaning.

Regards
