Which loan vintages are seasoning badly?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Portfolio risk is being discussed as a single book, although origination periods experienced different rates, channels and customer conditions. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that operational debit failures contaminate credit outcomes? Or are we actually seeing that recent vintages deteriorate faster? I also do not want us to miss the possibility that product mix creates the apparent vintage effect.

The practical decision is which vintage needs deeper review and whether policy or operations owns the next action. Please send a one-page finding note plus the underlying CSV for our own review; I need the exceptions and counter-examples, not only an average.

Work from the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context; time-appropriate news and macro-event context. Macro events provide context, not a causal estimate by themselves.

Regards
