Why did the payment fail, and who owns the fix? - 2025 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Operations is grouping all failed payments together even though the next action depends on the actual cause. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that insufficient funds explains the event? Or are we actually seeing that mandate status or retry sequencing explains the event? I also do not want us to miss the possibility that third-party or bank timeout explains the event.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2025 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the operational owner, customer message and monitoring rule for each failure family. Please send a short decision pack with no more than five slides and an attached evidence table; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. Do not infer a technical component failure beyond the error and timing fields available.

Regards
