Quick question: can we isolate genuine breaks from posting delay?

Hi,

This came up in a working session and nobody had the same definition.

Finance and Operations are reconciling the same activity to different days because authorisation, posting and statement dates do not always line up.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: retries or reversals are being counted twice; most breaks are timing differences; or a specific channel is posting outside the expected cut-off.

The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2020 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is whether matching rules, cut-off times or source ownership must change. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations. Statements are only available for selected accounts and months; use them as evidence samples, not as the population denominator.

Thank you
