Separate vintage, product and macro effects - 2025 control review

Team,

Before this becomes another standing report, can we answer the real question?

Portfolio risk is being discussed as a single book, although origination periods experienced different rates, channels and customer conditions. The possible stories are that product mix creates the apparent vintage effect, that operational debit failures contaminate credit outcomes, or that recent vintages deteriorate faster.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2025 as the new evidence point rather than recycling the earlier conclusion. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Please prepare a working Excel file with the exception population and clear columns. The output must help us decide which vintage needs deeper review and whether policy or operations owns the next action.

Data available: the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context; time-appropriate news and macro-event context.

Please state the limitation plainly: Macro events provide context, not a causal estimate by themselves.

Thanks
