Which branch visits are fixing another process?

Hi team,

Regional managers suspect that statement requests, card problems and failed digital journeys are creating avoidable branch demand.

We looked at a version of this before. For the October 2020 review, please show what changed and whether the earlier conclusion still holds. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Can you test these explanations rather than choosing one at the start?
- specific communications fail to explain the next step
- customers prefer branch for complex needs
- service failures drive repeat visits

The decision is which demand should be removed, redirected or staffed differently. Please give us a control view with the exceptions, owner and reason each item was included.

You should be able to build the evidence from customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. There is no branch queue-time or staff-roster table; infer demand drivers, not staffing productivity.

Thanks
