Follow-up: which loan vintages are seasoning badly?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Portfolio risk is being discussed as a single book, although origination periods experienced different rates, channels and customer conditions. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Could the answer be that recent vintages deteriorate faster? Or are we actually seeing that operational debit failures contaminate credit outcomes? I also do not want us to miss the possibility that product mix creates the apparent vintage effect.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2021 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which vintage needs deeper review and whether policy or operations owns the next action. Please send a Power BI page with drill-through to a reproducible case list; I need the exceptions and counter-examples, not only an average.

Work from the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context; time-appropriate news and macro-event context. Macro events provide context, not a causal estimate by themselves.

Regards
