Follow-up: which loan vintages are seasoning badly?

Hi,

This came up in a working session and nobody had the same definition.

Portfolio risk is being discussed as a single book, although origination periods experienced different rates, channels and customer conditions.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: recent vintages deteriorate faster; operational debit failures contaminate credit outcomes; or product mix creates the apparent vintage effect.

Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2022 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which vintage needs deeper review and whether policy or operations owns the next action. Please bring a Power BI page with drill-through to a reproducible case list, including a few cases we can trace from source to conclusion.

The available evidence is the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context; time-appropriate news and macro-event context. Macro events provide context, not a causal estimate by themselves.

Thank you
