Follow-up: one obligation, several attempts, unclear customer impact

Morning,

I need help with something that sounds simple but probably is not.

Payment attempts, reversals and late postings can create apparent duplicates or genuine duplicate customer impact. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

The questions I would ask in the room are:
1. What would we expect to see if some customers were debited more than once before reversal?
2. What evidence would instead support that late settlement creates false duplicates?
3. How do we rule out that retries are correctly linked?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2025 as the new evidence point rather than recycling the earlier conclusion. Please work towards the matching rule, customer-impact list and preventive control. A useful output would be a one-page finding note plus the underlying CSV for our own review.

Use transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; customer contacts, complaints and suggestions; available customer bank statements. One caution: Statement evidence is available only for selected accounts; use transaction identifiers and timing for the full population.

Regards
