Why are customers coming back to the branch? - 2023 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Regional managers suspect that statement requests, card problems and failed digital journeys are creating avoidable branch demand. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Could the answer be that specific communications fail to explain the next step? Or are we actually seeing that customers prefer branch for complex needs? I also do not want us to miss the possibility that service failures drive repeat visits.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2023 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which demand should be removed, redirected or staffed differently. Please send a model-ready table, data dictionary and an honest baseline; I need the exceptions and counter-examples, not only an average.

Work from customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. There is no branch queue-time or staff-roster table; infer demand drivers, not staffing productivity.

Regards
