Follow-up: separate vintage, product and macro effects

Morning,

I need help with something that sounds simple but probably is not.

Portfolio risk is being discussed as a single book, although origination periods experienced different rates, channels and customer conditions. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

The questions I would ask in the room are:
1. What would we expect to see if operational debit failures contaminate credit outcomes?
2. What evidence would instead support that product mix creates the apparent vintage effect?
3. How do we rule out that recent vintages deteriorate faster?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2025 as the new evidence point rather than recycling the earlier conclusion. Please work towards which vintage needs deeper review and whether policy or operations owns the next action. A useful output would be a model-ready table, data dictionary and an honest baseline.

Use the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context; time-appropriate news and macro-event context. One caution: Macro events provide context, not a causal estimate by themselves.

Regards
