Promise-to-pay quality, not collector volume - 2024 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Collectors record promises with different amounts and dates, and management needs a fair measure of promise quality. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Could the answer be that channel and timing affect outcomes? Or are we actually seeing that partial payments are being treated inconsistently? I also do not want us to miss the possibility that affordable promises are kept more often.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the promise definition, coaching view and model target. Please send a Power BI page with drill-through to a reproducible case list; I need the exceptions and counter-examples, not only an average.

Work from collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; customer contacts, complaints and suggestions. Do not rank individual collectors without workload, assignment and contact-attempt history.

Regards
