The return population changes depending on which snapshot we use

Hi team,

Regulatory Reporting needs a reproducible population of active, restricted and closed accounts with the relevant customer due-diligence fields.

We looked at a version of this before. For the May 2020 review, please show what changed and whether the earlier conclusion still holds. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Can you test these explanations rather than choosing one at the start?
- status changes are not applied consistently
- snapshot timing explains the difference
- company and individual rules are being mixed

The decision is the agreed population rule, data-quality exceptions and evidence trail. Please give us a short decision pack with no more than five slides and an attached evidence table.

You should be able to build the evidence from monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories. The dataset can test completeness and consistency, not determine whether every document is authentic.

Thanks
