Follow-up: the loan return needs a population bridge

Team,

Before this becomes another standing report, can we answer the real question?

Risk, Lending and Reporting are counting applications, approvals, booked loans and distressed accounts from different starting populations. The possible stories are that declined and withdrawn cases are mixed, that booked loans are missing from downstream repayment views, or that workflow timing explains most differences.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2022 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Please prepare a model-ready table, data dictionary and an honest baseline. The output must help us decide the canonical population and exception rules for the next return.

Data available: the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context.

Please state the limitation plainly: Do not present this as an official regulatory return without the required regulatory taxonomy and sign-off.

Thanks
