Fairness review: risk signal or missing-data signal? - 2025 control review

Morning,

I need help with something that sounds simple but probably is not.

Model Risk is concerned that channel, document availability and data completeness may become proxies for customer groups rather than genuine risk. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

The questions I would ask in the room are:
1. What would we expect to see if missing documents drive predictions?
2. What evidence would instead support that performance gaps disappear after controlling for product and income?
3. How do we rule out that branch and digital populations differ before modelling?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2025 as the new evidence point rather than recycling the earlier conclusion. Please work towards which features need restriction, monitoring or clearer business justification. A useful output would be a working Excel file with the exception population and clear columns.

Use monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments. One caution: Protected-attribute analysis must be governed and access-controlled; do not use ethnicity or gender for targeting or adverse treatment.

Regards
