Can we isolate genuine breaks from posting delay? - 2024 control review

Morning,

I need help with something that sounds simple but probably is not.

Finance and Operations are reconciling the same activity to different days because authorisation, posting and statement dates do not always line up. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

The questions I would ask in the room are:
1. What would we expect to see if retries or reversals are being counted twice?
2. What evidence would instead support that a specific channel is posting outside the expected cut-off?
3. How do we rule out that most breaks are timing differences?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2024 as the new evidence point rather than recycling the earlier conclusion. Please work towards whether matching rules, cut-off times or source ownership must change. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations. One caution: Statements are only available for selected accounts and months; use them as evidence samples, not as the population denominator.

Regards
