Follow-up: where does self-service hand the customer a new problem?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Digital containment is being reported as success even when customers later call, visit a branch or complain. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Could the answer be that handover occurs too late? Or are we actually seeing that contained contacts resolve the need? I also do not want us to miss the possibility that certain intents should begin with an agent.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which intents belong in self-service and how success should be measured. Please send a short decision pack with no more than five slides and an attached evidence table; I need the exceptions and counter-examples, not only an average.

Work from customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories. Containment is a proxy; use repeat contact and observable outcomes rather than claiming customer satisfaction.

Regards
