### Did the retry cure the payment or duplicate it?

---

Hi,

This came up in a working session and nobody had the same definition.

Payment attempts, reversals and late postings can create apparent duplicates or genuine duplicate customer impact.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: late settlement creates false duplicates; retries are correctly linked; or some customers were debited more than once before reversal.

Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

What we need to decide is the matching rule, customer-impact list and preventive control. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; customer contacts, complaints and suggestions. Statement evidence is available only for selected accounts; use transaction identifiers and timing for the full population.

Thank you
