Which failures are really sitting with a third party?

Hi,

This came up in a working session and nobody had the same definition.

Third-Party Risk wants to understand whether external dependencies are repeatedly associated with failed or delayed customer journeys.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: repeat incidents create disproportionate customer contact; third-party timeouts cluster by channel; or internal latency is being attributed externally.

There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

What we need to decide is which supplier relationship requires evidence gathering or a formal service review. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. There is no vendor master, contract, SLA or invoice table. Treat external-context fields as indicators, not contractual proof.

Thank you
