## Which source change silently changed the business answer?

---

Team,

Before this becomes another standing report, can we answer the real question?

Data Engineering sees changing schemas and needs to distinguish safe expansion from business-definition drift. The possible stories are that null patterns reveal a source rollout rather than missing customer data, that new fields are additive, or that renamed or recoded fields break history.

The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Please prepare a Power BI page with drill-through to a reproducible case list. The output must help us decide the data contract, quarantine rule and backfill requirement.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields.

Please state the limitation plainly: A technical schema match does not prove semantic consistency; business owners must confirm meaning.

Thanks
