Why did the payment fail, and who owns the fix?

Hi,

This came up in a working session and nobody had the same definition.

Operations is grouping all failed payments together even though the next action depends on the actual cause.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: mandate status or retry sequencing explains the event; third-party or bank timeout explains the event; or insufficient funds explains the event.

There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

What we need to decide is the operational owner, customer message and monitoring rule for each failure family. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. Do not infer a technical component failure beyond the error and timing fields available.

Thank you
