Two source files tell different stories about the same event

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

A requested analysis changes depending on whether the team starts from transaction, debit-order, account-status or customer-contact records. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

Could the answer be that the sources record different stages of one event? Or are we actually seeing that matching logic is joining unrelated records? I also do not want us to miss the possibility that one source is updated retrospectively.

The practical decision is the source precedence rule and the cases that must remain explicitly unresolved. Please send a control view with the exceptions, owner and reason each item was included; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. Do not force agreement by dropping exceptions; preserve contradictory evidence for owner review.

Regards
