Where does cash access fail when customers need it most?

Morning,

I need help with something that sounds simple but probably is not.

ATM failures and blocked-card issues can shift customers toward branches, especially during infrastructure disruption. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

The questions I would ask in the room are:

1. What would we expect to see if customers switch to smaller withdrawals or branch contact?
2. What evidence would instead support that cash-bin or host issues dominate?
3. How do we rule out that specific provinces show repeat access failure?

Please work towards where contingency communication and ATM support should be prioritised. A useful output would be a control view with the exceptions, owner and reason each item was included.

Use ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; monthly customer and KYC snapshots. One caution: The data does not contain branch cash holdings or queue time.

Regards
