A decline is only the first event; what did the customer do next?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

The same decline code can lead to a successful retry, an ATM attempt, a phone call or lost activity. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that most declines recover immediately? Or are we actually seeing that poor explanations drive complaints more than the decline itself? I also do not want us to miss the possibility that repeat declines cluster by card state or channel.

The practical decision is which decline reasons need rule, message or service changes. Please send a control view with the exceptions, owner and reason each item was included; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. The data does not contain merchant terminal logs or card-scheme dispute outcomes.

Regards
