Which exceptions quietly become old?

Hi,

This came up in a working session and nobody had the same definition.

Operations needs an ageing view that prioritises unresolved customer impact rather than raw exception count.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: older cases cluster in one process; small-value cases remain open because ownership is unclear; or status updates close records without resolving the transaction.

There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

What we need to decide is the exception priority rule and escalation threshold. Please bring a working Excel file with the exception population and clear columns, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; collections cases, promises to pay and recovery payments; monthly account snapshots, status events, limits, product enrolments and signatories. Use observable dates and outcomes; do not infer internal queue age where no queue record exists.

Thank you
