Quick question: why do newly opened accounts go quiet?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Product wants to understand why some customers make an initial deposit but fail to establish recurring activity. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that the account was opened for a one-off purpose? Or are we actually seeing that fees or a failed first journey discourage use? I also do not want us to miss the possibility that activation friction causes early dormancy.

The practical decision is which onboarding intervention or product proposition should be tested. Please send a short decision pack with no more than five slides and an attached evidence table; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; available initial-deposit records up to the request date; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. The data cannot observe the customer's relationship with competing banks.

Regards
