Which promises are realistic at the moment they are made?

Hi team,

Collectors record promises with different amounts and dates, and management needs a fair measure of promise quality.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Can you test these explanations rather than choosing one at the start?

- partial payments are being treated inconsistently
- channel and timing affect outcomes
- affordable promises are kept more often

The decision is the promise definition, coaching view and model target. Please give us a one-page finding note plus the underlying CSV for our own review.

You should be able to build the evidence from collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; customer contacts, complaints and suggestions. Do not rank individual collectors without workload, assignment and contact-attempt history.

Thanks
