Quick question: are we seeing pass-through accounts or ordinary cash-flow behaviour?

Morning,

I need help with something that sounds simple but probably is not.

Financial Crime wants to test whether rapid receipt and onward movement forms a network pattern or reflects ordinary customer behaviour. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

The questions I would ask in the room are:

1. What would we expect to see if new accounts act as pass-through accounts?
2. What evidence would instead support that shared beneficiaries connect otherwise separate customers?
3. How do we rule out that salary, family support or business cash flow explains the pattern?

Please work towards which cases deserve investigation and which monitoring rule needs a better peer group. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; debit-order mandates, collection dates, suspensions and cancellations. One caution: The output is a triage hypothesis. Do not label a customer a mule without investigation and external evidence.

Regards
