Audit sample: activity after account closure

Morning,

I need help with something that sounds simple but probably is not.

Internal Audit wants to test whether an account status change consistently stops transactions, ATM access, debit orders, collections and campaigns. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

The questions I would ask in the room are:

1. What would we expect to see if controls propagate on the same day?
2. What evidence would instead support that manual exceptions are not documented consistently?
3. How do we rule out that some downstream systems lag?

Please work towards whether this is an isolated exception, a design weakness or a control operating failure. A useful output would be a working Excel file with the exception population and clear columns.

Use monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; debit-order mandates, collection dates, suspensions and cancellations; collections cases, promises to pay and recovery payments; campaign design and customer responses. One caution: The result is a data-based control test and still requires process-owner evidence.

Regards
