Quick question: the incident clock and the customer clock are not the same

Hi team,

Infrastructure can see technical symptoms, but incident severity should reflect failed customer journeys and repeat attempts rather than machine alerts alone.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Can you test these explanations rather than choosing one at the start?

- latency rises before visible failure
- a small terminal or channel group creates most harm
- customers retry across channels and create duplicates

The decision is incident priority, root-cause ownership and the customer-remediation population. Please give us a one-page finding note plus the underlying CSV for our own review.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. The dataset has channel and ATM telemetry, not complete application, server or network logs.

Thanks
